

$$F = G \frac{m_1 m_2}{d^2}$$

**Day 3 : Create your Own
formula in Excel using A.I.**

$$\frac{df}{dt} = \lim_{h \rightarrow 0} \frac{f(t+h) - f(t)}{h}$$

Prompt

Create an Excel VBA custom formula that extracts and separates data from a single cell containing text like:

"Address=Chandauli|FathersName=GautamSinghMaurya|FeeType=FullFees|NameOfCourse=ANM|Semester=1thSem|StudentName=BabitaMourya|Year=1ndYear".

The formula should:

1. Split the text using the pipe | as a separator.
2. Extract only the values after the = sign (skip headers).
3. Add spaces before capital letters in names (e.g. "GautamSinghMaurya" → "Gautam Singh Maurya").
4. Return all results horizontally across columns so that it can be dragged down for multiple rows. Name the formula SplitStudentData.
