

Day 6 : AI-Powered Workbook **Automation**

Prompt

Write an Excel VBA automation program that converts each worksheet in my current Excel file into an individual PDF. The program should prompt the user to select a destination folder where all the PDFs will be saved, using each sheet's name as its corresponding PDF filename. Additionally, ensure that during the PDF conversion, all columns are adjusted to fit on a single page so the data is properly displayed in each PDF.

Prompt

-
- Write an Excel VBA program that creates an index sheet for the workbook. The index should display:
 - A serial number in the first column.
 - The names of all worksheets in the second column, each with a hyperlink to its respective sheet.
 - The number of rows and columns containing data in each sheet in the next columns.
If a sheet is blank, leave the row and column count cells empty.
