

Day 5 : File Management Automation Using A.I

Prompt

Write an Excel VBA automation program to manage and organize files by their extensions. The program should first prompt the user to select a **source folder** containing various file types (e.g., Excel, Word, PDF, video, image files, etc.). Then, it should prompt the user to select a **destination folder**. Within the destination folder, the program should automatically create separate subfolders based on file extensions (for example, .xlsx files in a “.xlsx Files” folder, .docx files in a “.docx Files” folder, .mp4 files in a “.mp4 Files” folder, .png and .jpg files in respective folders, etc.), and move each file into its corresponding folder.

Prompt

Write an Excel VBA automation program that allows the user to select a folder through a pop-up dialog. Once the folder is selected, the program should read all the files within that folder and list their details in Excel, including the file name, file path, file size, file type, date created, date last modified, and any other relevant file properties.
